

Example for Trigger output connection

The open collector gate(74LS06) is used for the trigger output circuit in the controller. In the Figure 1, the amplitude of the trigger output pulse is 24V, because of the DC24V power supply connection.

In the Figure 2, the amplitude of the trigger output pulse is 5V, because of the +5V power supply connection. In this case, you need to prepare the +5V power supply.
